Oleoresin Paprika - Abbracorp

Chilli oleoresin is obtained by the extraction of chillies (the fruit of red pepper, Capsicum annum L. or Capsicum frutescens L.) with approved food grade solvent and subsequent careful removal of the solvent by distillation. Besides intense pungency due to capsaicin and small quantities of allied alkaloids, the chilli oleoresin will have dark red colour due to carotenoid pigments.

Indian Standard: CHILLI OLEORESIN\u2022SPECIFICATION

Paprika oleoresin (also known as paprika extract and oleoresin paprika) is an oil-soluble extract from the fruits of Capsicum annum or Capsicum frutescens, and is primarily used as a colouring and/or flavouring in food products. It is composed of vegetable oil (often in the range of 97% to 98%), capsaicin, the main flavouring compound giving pungency in higher concentrations, and capsanthin and capsorubin, the main colouring compounds (among other carotenoids).

Paprika oleoresin - Wikipedia

OLEORESINS. Spice oleoresins represent the complete flavour profile of the spice. It contains the volatile as well as non volatile constituents of spices. Oleoresins can be defined as the true essence of the spices and can replace whole/ground spices without impairing any flavour and aroma characteristic. Oleoresins are obtained from spices by extraction with a non-aqueous solvent followed by removal of the solvent by evaporation.

[eBooks] Chilli Oleoresin Paprika Oleoresin Paprika ...

In paprika A colouring agent, oleoresin of paprika, is extracted from the ground pods and used to impart bright red colour to meat and sausage products and to other processed foods.

Capsicum has been used since ancient times not only as a traditional medicine but also as a natural colorant. The medicinal properties of capsicum make it popular in both ayurvedic and homeopathic treatments. In Capsicum: The Genus Capsicum, experts provide information on all aspects of this plant, including its ethnobotany, chemistry, pharmacology

Chillies and paprika in international trade; Trading structures and procedures, tariffs.

Spices are high value, export-oriented crops used extensively in food and beverage flavourings, medicines, cosmetics and perfumes. Interest is growing however in the theoretical and practical aspects of the biosynthetic mechanisms of active components in spices as well as the relationship between the biological activity and chemical structure of these secondary metabolites. A wide variety of phenolic substances and amides derived from spices have been found to possess potent chemopreventive, anti-mutagenic, anti-oxidant and anti-carcinogenic properties. Representing the first discussion of the chemical properties of a wide cross section of important spices, this book covers extensively the three broad categories of plant-derived natural products: the terpenoids, the alkaloids and the phenyl propanoids and allied phenolic compounds. Spice crops such as black pepper, ginger, turmeric and coriander are covered with information on botany, composition, uses, chemistry, international specifications and the properties of a broad range of common and uncommon spices.

Many plants have been used for centuries as sources of spices for culinary use. Recently there has been an upsurge of interest in diversifying the range of such spices and in their agronomy, as alternative crops, in both temperate and tropical countries. This book provides a scientific review and guide to the botany and agronomy of the major families of plants used for the production of spices. Contents include: world production and trade; and chapters on Cruciferae, Lauraceae, Leguminosae, Piperaceae, Solanaceae, Umbelliferae, Zingiberaceae, and Minor crops.

The global changes warranted fastness in food production system and fast foods. In tune with demand, crop production also oriented accordingly. However, the proverb 'Health is a Wealth' is reminded us to keep vigil on system and method of food production and food safety. The ill-effect of conventional chemical based farming well documented and public realized the importance organically produced food and efforts are being made to popularize the organic production. India is a "Land of Spices", each state or union territory in India cultivates one or other spice. Since spices form a part of many medicines the demand for organically produced spices is increasing considerably. Assuming a market growth of 10% in Europe, USA and Japan for organic spice products the world demand for organic spices may grow to 57000 tonnes in the next 10 years. Large scale use of high analysis fertilizers and pesticides result environmental hazards and imbalances in soil nutrients. Since spices are high valued and export oriented in nature it is imperative to keep the levels of pesticide residues below tolerance limits in view of the standards set by the importing countries. Hence the book on "Organic Spices" is timely and covers all aspects of organic spice production. The topic includes historical spice trade and importance of spices in food chain. Brief account on organic agriculture movement in the world and its present status and opportunity for organic spices in the world market are given. The chemistry and different methods of composting are included in the organic manures chapter will be informative. Microbes play a greater role in agriculture, a separate chapter devoted on microbes and plant growth promoting rhizobacteria would definitely enrich the reader. Not only that, the topics on biological control of insect pests, nematodes, fungus and bacteria of spices highlighted in separate chapters would be of interest in organic production system. The importance, composition, uses, botany and varieties, organic way of production of spices like black pepper, cardamom, ginger, turmeric, chillies and paprika, nutmeg, vanilla, seed spices like cumin, fennel, fenugreek, coriander and their harvest and post harvest processing are enumerated. The chapters on good agricultural practices (GAP) and organic certification procedures outlined for adoption. This would serve as a reference book for researchers, teachers and students besides farmers, traders and consumers.

Herbs and spices are among the most versatile and widely used ingredients in food processing. As well as their traditional role in flavouring and colouring foods, they have been increasingly used as natural preservatives and for their potential health-promoting properties, for example as antioxidants. Edited by a leading authority in the field, and with a distinguished international team of contributors, the Handbook of herbs and spices provides an essential reference for manufacturers wishing to make the most of these important ingredients. The first group of chapters looks at general issues including quality indices for conventional and organically produced herbs, spices and their essential oils. The main body of the handbook consists of over twenty chapters covering key spices and herbs from aniseed, bay leaves and black pepper to saffron, tamarind and turmeric. Each chapter covers key issues from definition and classification including: chemical structure cultivation post-harvest processing uses in food processing functional properties quality indices methods of analysis The Handbook of herbs and spices is a standard reference for all manufacturers using herbs and spices in their products.

This book "Spices" comprehends and provides latest information on economic importance, botany, chemical composition, crop improvement, agro-technology, post harvest technology and end uses of 52 spices identified by the spices board. The book is organized into 6 chapters. The authors with their vast experience in tropical spices have brought their scientific as well as practical experience in collecting and presenting the information concisely. Although the book is a sublimation of the Indian expertise in spices, the contents are very useful and relevant internationally. The book is targeted to the students and researchers in the area of horticulture, agriculture, industry people, exporters processors and end users.

This book combines several ideas and philosophies and provides a detailed discussion on the value addition of fruits, vegetables, spices, plantation crops, floricultural crops and in forestry. Separate chapters address the packaging, preservation, drying, dehydration, total quality management and supply chain management of horticultural crops. The book explains value addition as a process of increasing the economic value and consumer appeal of a commodity with special reference to horticultural crops. Each chapter focuses on a specific area, exploring value addition as a production/ marketing strategy driven by customer needs and preferences. But, as such, it is also a more creative field, calling for more imagination than calculated, routine work. Value is added to the particular produce item when the product is still available when the season is out and the demand for the product exceeds the available supply. Value addition is an important factor in the growth and development of the horticultural sector, both in India and around the world. But very little information is available on this particular aspect of horticulture. Albert Einstein famously said, "Try not to become a man of success, but rather try to become a man of value." This message is not only true for those people who want to make more of themselves, but also for those who want their creation or product in any form to excel. And it certainly applies to horticultural crops, which are extremely perishable. It is true that loss reduction is normally less costly than equivalent increases in production. The loss of fresh produce can be minimized by adopting different processing and preservation techniques to convert the fresh vegetables into suitable value-added and diversified products, which will help to reduce the market glut during harvest season. Value-added processed products are products that can be obtained from main products and by-products after some sort of processing and subsequently marketed for an increased profit margin. Generally speaking, value-added products indicate that for the same volume of primary products, a higher price is achieved by means of processing, packing, enhancing the quality or other such methods. The integrated approach from harvesting to the delivery into the hands of the consumer, if handled properly, can add value to fresh produce on the market. But most of the fresh produce has a limited life, although it can be stored at appropriate temperature and relative humidity for the same time. If such produce is processed just after harvesting, it adds value and stabilizes the processed products for a longer time. Preparing processed products will provide more variety to consumers and improve the taste and other sensory properties of food. This will also promote their fortification with nutrients that are lacking in fresh produce. By adopting suitable methods for processing and value addition, the shelf life of fresh produce can be increased manifold, which supports their availability year-round to a wider spectrum of consumers on both the domestic and international market. With increased urbanization, rising middle class purchasing power, changing food habits and a decline in making preserved products in individual homes, there is now a higher demand for industry-made products on the domestic market. In spite of all these aspects, only 1-2.2% of the total produce is processed in developing countries, as compared to 40-83% in developed countries. The horticultural export industry offers an important source of employment for developing countries. For instance, horticulture accounts for 30% of India's agricultural GDP from 8.5% of cropped area. India is the primary producer of spices, second largest producer of fruits and vegetables and holds a prominent position with regard to most plantation crops in the world. The cultivation of horticultural crops is substantially more labor-intensive than growing cereal crops and offers more post-harvest opportunities for the development of value-added products. This book offers a valuable guide for students of horticulture, as well as a comprehensive resource for educators, scientists, industrial personnel, amateur growers and farmers.
