PIVOT SHIFT TEST is a specific test for ACL deficient knee (ACL injury- acute and chronic). It is pathognomonic for an ACL tear and is best demonstrated in the chronic setting when there is a chronic ACL tear. The pivot shift test goes from extension (tibia subluxed) to flexion, with the tibia reduced by the iliotibial band.

Shoulder Orthopaedic Tests | Musculoskeletal Key

In passive ROM tests, the therapist will hold the extremity and move it. The therapist may also hold the next joint steady to isolate the movement of the joint being tested. Special Tests: Flexibility Tests. Flexibility tests are used to measure the range of motion in a joint and are often part of the physical examination.

Special Tests: Physical Examination

Orthopaedic Testing of SIJ. There have been several studies investigating the reliability of using multiple orthopaedic tests compared to the 'gold standard' of nerve blocks, and several reviews which aim to synthesise studies of this nature to guide clinical practice. Van der

Wurff et al (2006) used a regimen of five tests (Distraction, compression, thigh thrust, Gaenslens and Patricks).
