Quality of service (QoS) is the description or measurement of the overall performance of a service, such as a telephony or computer network or a cloud computing service, particularly the performance seen by the users of the network. To quantitatively measure quality of service, several related aspects of the network service are often considered, such as packet loss, bit rate, throughput ...

End-to-end delay or one-way delay (OWD) refers to the time taken for a packet to be transmitted across a network from source to destination. It is a common term in IP network monitoring, and differs from round-trip time (RTT) in that only path in the one direction from source to destination is measured.

Re: End to end QoS. Hi: Yes QoS is setup across the entire network, up to a QoS "boundary". The boundary is where you will setup QoS Categorizations and QoS Marking of cos (802.3 cos bits), dscp (differentiated services code point), and ip precedence (Layer 3 TOS bits), in this case the ethernet port where the server is connected.
