The Waterborne Symposium: Full Schedule

A novel, waterborne epoxy system comprised of non-ionic stabilized dispersions of a solid epoxy resin and an amine curing agent has been designed for ambient-cure coatings. The performance characteristics of coatings formulated from the new system have been compared to a standard system. The new system produced formulated coatings with robust performance over a wide range of amine-to-epoxy ...

Access Free Formulating High Performance Waterborne Epoxy Coatings

An epoxy resin system generally consists of a curing agent and an epoxy resin. Both the curing agent and the epoxy resin can be made waterborne. Solid epoxy resin (molecular weight >1000) dispersions are available and consist of an epoxy resin dispersed in water sometimes with the aid of co-solvents and surfactants.

In this new edition, *Thermosets: Structure, Properties, and Applications* builds on and updates the existing review of mechanical and thermal properties, as well

Access Free Formulating High Performance Waterborne Epoxy Coatings

as rheology and curing processes of thermosets, and the role of nanostructures in thermoset toughening. All chapters have been updated or re-written, and new chapters have been added to reflect ongoing changes and developments in the field of thermosetting materials and the applications of these materials. Applications of thermosets are the focus of the second part of the book, including the use of thermosets in the building and construction industry, aerospace technology and as insulation materials. Thermoset adhesives and coatings, including epoxy resins, acrylates and polyurethanes are also discussed, followed by a review of thermosets for electrical applications. New chapters include coverage

Access Free Formulating High Performance Waterborne Epoxy Coatings

of thermoset nanocomposites, recycling issues, and applications such as consumer goods, transportation, energy and defence. With its distinguished editor and international team of expert contributors, the second edition of *Thermosets: Structure, Properties, and Applications* is an essential guide for engineers, chemists, physicists and polymer scientists involved in the development, production and application of thermosets, as well as providing a useful review for academic researchers in the field. Links structure, properties, and applications, making this book relevant to both academia and engineers in industry. Includes entirely new chapters on the use of thermosets in aerospace, transport, defense, and a

Access Free Formulating High Performance Waterborne Epoxy Coatings

range of consumer applications Enables practitioners to stay current on the latest developments in recycling of thermosets and their composites

Paint coatings remain the most widely used way of protecting steel structures from corrosion. This important book reviews the range of organic paint coatings and how their performance can be enhanced to provide effective and lasting protection. The book begins by reviewing key factors affecting the success of a coating, including surface preparation, methods of application, selecting an appropriate paint and testing its effectiveness. It also discusses why coatings fail, including how they degrade, and what

Access Free Formulating High Performance Waterborne Epoxy Coatings

can be done to prevent these problems. Part two describes the main types of coating and how their performance can be enhanced, including epoxies, polyester, glass flake, fluoropolymer, polysiloxane and waterborne coatings. The final part of the book looks at applications of high-performance organic coatings in such areas as reinforced concrete, pipelines, marine and automotive engineering. With its distinguished editor and international team of contributors, High-performance organic coatings is a valuable reference for all those concerned with preventing corrosion in steel and other metal structures. Reviews the factors affecting the success of a coating Describes the main types of coating and

Access Free Formulating High Performance Waterborne Epoxy Coatings

how their performance can be enhanced, including epoxies, polyester and waterborne coatings Examines applications in such areas as reinforced concrete pipelines and marine engineering

This collection of 463 water-based trade and industrial formulations will be of value to technical and managerial personnel in paint manufacturing companies and firms which supply raw materials or services to these companies, and to those interested

Access Free Formulating High Performance Waterborne Epoxy Coatings

in less hazardous, environmentally safer formulations. The data consists of selections of manufacturers' suggested formulations made at no cost to, or influence from, the makers and distributors of these materials. Only the most recent data is included. Any solvent containment is minimal.

In the only book to focus on new developments and innovations in this hot field international experts from industry and academia present everything scientists need to know. The first section provides general concepts of the synthesis and properties of epoxy polymers and serves as a basis for the subsequent chapters. The second section includes new types of

Access Free Formulating High Performance Waterborne Epoxy Coatings

epoxy polymers recently commercialized or not yet present on the market, while the third section includes chapters related to the capacity of generating controlled nanostructures in epoxy-based materials. A fourth section is devoted to innovations in epoxy-based materials such as adhesives, coatings, pre-pregs, structural foams, injection-molded products and self-healing epoxies. Concluding remarks and perspectives are discussed in a short final section. The result is a one-stop reference source, collecting scientific and technological breakthroughs otherwise spread over hundreds of publications, patents and reports.

Polymer and colloidal chemistry, fabrication and testing of waterborne coatings PURs, polyisocyanates, acrylics, vinyls and more Sustainable surfactants, water soluble catalysts, high-throughput rheology, pigments This series volume contains 34 original papers on the chemistry and formulation of waterborne coatings. Chapters cover UV curing, testing and applications in many areas of latex paints, grouting and varnishes. The book discusses advances in curing, adhesion, superhydrophobic coatings and additives, with special attention to sustainable materials and methods.

This collection of 232 water-based trade and industrial

Access Free Formulating High Performance Waterborne Epoxy Coatings

formulations will be of value to technical and managerial personnel in paint manufacturing companies and firms which supply raw materials or services to these companies, and to those interested in less hazardous, environmentally safer formulations. The book will be useful to both those with extensive experience as well as those new to the field. This book includes new and different formulations than those included in the previous volumes. The data consist of selections of manufacturers' suggested formulations made at no cost to, nor influence from, the makers or distributors of these materials. The information given is presented as supplied; the manufacturer should be contacted if there are any

Access Free Formulating High Performance Waterborne Epoxy Coatings

questions. Only the most recent data supplied us has been included. Any solvent contained is minimal. The table of contents is organized in such a way as to serve as a subject index. The formulations described are divided into sections which cover exterior, interior, and exterior and/or interior water-based paints, enamels, and coatings, as indicated below. Included in the descriptive information for each formulations, where available, the following properties may be listed: viscosity, solids, content, % nonvolatiles, pigment volume concentration, density, pH, spatter, leveling, sag resistance, scrub stability, freeze-thaw stability, ease of application, gloss foaming, cratering, brightness, opacity, water

spotting, adhesion to chalk, brush cleanup, reflectance, and sheen.

This book presents both background material and state-of-the-art research on waterborne coatings. It analyzes the most likely developments in resins chemistry, and examines application properties and in situ methods of cross-linking applied films. It also discusses the primary parameters in drying and spray applications.
