This book presents an authoritative overview of the emerging field of person-centered psychiatry. This perspective, articulating science and humanism, arose within the World Psychiatric Association and aims to shift the focus of psychiatry from organ and disease to the whole person within their individual context. It is part of a broader person-centered perspective in medicine that is being advanced by the International College of Person-Centered Medicine through the annual Geneva Conferences held since 2008 in collaboration with the World Medical Association, the World Health Organization, the International Council of Nurses, the International

Federation of Social Workers, and the International Alliance of Patients' Organizations, among 30 other international health institutions. In this book, experts in the field cover all aspects of person-centered psychiatry, the conceptual keystones of which include ethical commitment; a holistic approach; a relationship focus; cultural sensitivity; individualized care; establishment of common ground among clinicians, patients, and families for joint diagnostic understanding and shared clinical decision-making; people-centered organization of services; and person-centered health education and research.

The mission of the Center for Education and Drug Abuse Research (CEDAR) is to delineate the etiology of Substance Use Disorder (SUD). This book describes several facets of CEDAR'S ongoing research program. To illustrate the breadth of ongoing investigation, the articles address the genetic biochemical, psychological, and environmental factors influencing the risk for SUD. In addition, new

Advances in the standardization, precision and thoroughness of psychiatric diagnosis are being supplemented with attention to personalized or ideographic descriptive approaches. This promises not only to enhance the clinician's understanding of a case but to allow a fuller and more effective use of the evolving range of therapeutic possibilities. To reflect these developments, the Section on Classification, Diagnostic Assessment and Nomenclature of the World Psychiatric Association has prepared this volume which is organized around five prominent

themes in contemporary psychiatric diagnosis: -major regional perspectives - ICD-10 - comprehensive diagnosis through the multiaxial model - treatment planning and organization of health services - the role and challenges of psychiatric diagnosis in primary health care.

Psychiatric diagnosis is one of the most important topics within the broad field of psychiatry. Clear, accurate definitions of the various disorders are essential for clinicians around the world to be confident that they are classifying patients in the same way, thereby enabling comparisons of treatment regimens and their outcomes. There are two major classification systems in use, one

produced by the World Health Organization, the WHO International Classification of Diseases, Mental Disorders Chapter, and one by the American Psychiatric Association, the well known Diagnostic and Statistical Manual of Mental Disorders. Both of these are being revised so this book from the prestigious World Psychiatric Association is especially timely. In this book, leading experts in the field provide a broad and integrated coverage of the concepts, structure and context of psychiatric diagnosis. It begins by addressing mental health and illness around the world from historical, philosophical and cultural perspectives. Health is approached comprehensively, to

include such aspects as resilience, resources and quality of life. The book then covers major specific psychopathology topics in Section II, including new categorizations and dimensional approaches. Section III concentrates on the complex problem of comorbidity, a primary challenge for modern diagnostic classifications in psychiatry. Finally, Section IV reviews emerging international diagnostic systems in psychiatry, considering innovative models and adaptations. This book will be essential reading for anyone involved in the diagnosis of psychiatric disorders.

second half of the 21st century. Evidence shows that misdiagnosis of mental disorders occurs more frequently in minority populations. Thus, the domestic and international utility of DSM-IV and its companions will depend on their suitability for use with various cultures. A key feature of this volume is the collaboration of cultural experts, members of the National Institute of Mental Health (NIMH) Culture and Diagnosis Group, nosologists, and members of the DSM-IV Task Force and Work Groups. The NIMH and the American Psychiatric Association held a conference on Culture and Psychiatric Diagnosis to prepare for DSM-IV. Culture and Psychiatric Diagnosis developed from that meeting to enhance the

cultural validity of DSM-IV. If clinicians are to become culturally sensitive, they must understand the criteria that define a disorder and consider the cultural context of the person being examined. They can then ascertain whether the criteria are applicable in the present cultural context of the patient. Culture and Psychiatric Diagnosis will benefit all clinicians treating minority patients because it documents and clarifies how cultural factors influence psychopathology; the manifestations, assessment, and course of mental disorders, and the response to treatment.

consequently integrating prevention, care and treatment (i.e. pharmacological, psychosocial rehabilitation and psychotherapeutic) in medicine. It is becoming increasingly recognized that one method of combating spiraling health care costs in developed nations is to integrate psychiatric care into medicine including primary care settings. This volume reviews the main issues relative to the paradigm of a person-centered and recovery-oriented approach that should imbue all medical areas and specialties. It proposes integration methods in screening and assessment, clinimetric approach, dignity conserving care, cross-cultural and ethical aspects, treatment and training

as a basic and mandatory need of a whole psychosomatic approach bridging the several specialties in medicine. As such, the book addresses a topic that all physicians, including primary care and psychiatric professionals in a wide variety of mental health settings are currently discussing, planning and preoccupied with, namely the task of integrating mental health into all the medical fields, including primary care, cardiology, psychiatry, oncology and so on.

Prior and subsequent to the publication of the third edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-III), we have witnessed a considerable upsurge in the

quantity and quality of research concerned with the psychiatric diagnostic process. There are several factors that have contributed to this empirical influx, including improved diagnostic criteria for many psychiatric disorders, increased nosological attention to childhood psychopathology, and development and standardization of several structured diagnostic interview schedules for both adult and child populations. With the advent of DSM-III-R, and in anticipation of DSM-IV, diagnostic labels and their definitions have been in a state of change, as evinced by the many refinements and modifications currently taking place. However, the basic purpose or *raison d'etre* of the

nosological scheme has not been altered. Psychiatric diagnosis is the means by which we classify or categorize human psychopathology. And, as is the case in the medical arena, psychiatric diagnosis serves three central functions: classification, communication, and prediction. As research accumulates, our understanding of psychiatric disorders increases, and we are in a much better position to classify reliably and with validity, as well as to communicate and predict. Despite periodic changes in the diagnostic system, the basic strategies for conducting diagnostic research (e. g. , genetic-family studies, biological markers, follow-up studies, etc.) do not vary appreciably over

Many of the current debates about validity in psychiatry and psychology are predicated on the unexpected failure to validate

commonly used diagnostic categories. The recognition of this failure has resulted in, what Thomas Kuhn calls, a period of extraordinary science in which validation problems are given increased weight, alternatives are proposed, methodologies are debated, and philosophical and historical analyses are seen as more relevant than usual. In this important new book in the IPPP series, a group of leading thinkers in psychiatry, psychology, and philosophy offer alternative perspectives that address both the scientific and clinical aspects of psychiatric validation, emphasizing throughout their philosophical and historical considerations. This is a book that all psychiatrists, as well as
