The atoms in a polyatomic ion are usually covalently bonded to one another, and therefore stay together as a single, charged unit. Rule 1. The cation is written first in the name; the anion is written second in the name. Rule 2. When the formula unit contains two or more of the same polyatomic ion, that ion is written in parentheses with the subscript written outside the parentheses.

**Naming Compounds Containing Polyatomic Ions - Wisc-Online OER**  
Naming polyatomic ions is harder, but doable. First, name the cation, which is just the name of the element. Next, name the anion. This gets trickier. Let's first talk about a polyatomic ionic compound that contains oxygen. If the polyatomic anion contains oxygen, it is called an oxyanion. If it can form more than one form of oxyanion, it gets a suffix of either -ate or -ite. There are some common oxyanions that most people memorize.

Compounds containing polyatomic ions act as ionic compounds. The name of the compound is created by taking the name of the metal and then adding the name of the polyatomic ion. There is no easy way around simply memorizing the polyatomic ions. Some examples of this would be,  $\text{Mg}(\text{OH})_2$  The metal is Magnesium ( $\text{Mg}^{+2}$ ) and the polyatomic ion is Hydroxide ( $\text{OH}^{-1}$ ) Magnesium Hydroxide.  $\text{KClO}_3$

## How do you name compounds containing polyatomic ions ...

It is important to realize that compounds containing polyatomic ions must be electrically neutral. In a crystal of calcium sulfate, for instance, there must be equal numbers of  $\text{Ca}^{2+}$  and  $\text{SO}_4^{2-}$  ions in order for the charges to balance. The formula is thus  $\text{CaSO}_4$ . In the case of

sodium sulfate, by contrast, the  $\text{Na}^+$  ion has only a single charge. In this case we need two  $\text{Na}^+$  ions for each  $\text{SO}_4^{2-}$  ion in order to achieve

Rules for Naming Ionic Compounds Containing Polyatomic Ions Polyatomic ions are ions which consist of more than one atom. For example, nitrate ion,  $\text{NO}_3^-$ , contains one nitrogen atom and three oxygen atoms. The atoms in a polyatomic ion are usually covalently bonded to one another, and therefore stay together as a single, charged unit.
