The National Cancer Institute's (NCI) Clinical Trials Cooperative Group Program has played a key role in developing new and improved cancer therapies. However, the program is falling short of its potential, and the IOM recommends changes that aim to transform the Cooperative Group Program into a dynamic system that efficiently responds to emerging scientific knowledge; involves broad cooperation of stakeholders; and leverages evolving technologies to provide high-quality, practice-changing research.

Gastrointestinal Oncology: A Critical Multidisciplinary Team Approach is the first evidence-based reference text designed for the multidisciplinary team of medical professionals involved in the investigation, diagnosis, and management of patients with gastrointestinal cancer. Written and edited by leading international experts in the field it sets the standard in clinical practice for dealing with esophageal, gastric, intestinal, colonic, hepatobiliary, pancreatic, and other GI tumors. The book is divided into twenty-five clinical chapters each addressing the specific cancers affecting the gastrointestinal tract. Each chapter is written by a team of authors, with each contributor specially chosen to represent a different role in the MDT. This multidisciplinary team approach reflects the current care of GI cancer patients and enables clinical decision making and patient management. All the chapters have been tried and tested in MDT meetings in leading cancer centers around the world. *Gastrointestinal Oncology: A Critical Multidisciplinary Team Approach* provides in-depth evidence-based knowledge and is well illustrated throughout with color photographs, line drawings, and diagrams. This authoritative and practical resource is an essential reference for the entire MDT including gastroenterologists, hepatologists, GI surgeons, medical oncologists, radiation therapists, interventional radiologists, pathologists, specialist nurses, and clinical scientists.

Survey Methodology is becoming a more structured field of research, deserving of more and more academic attention. The SAGE Handbook of Survey Methodology explores both the increasingly scientific endeavour of surveys and their growing complexity, as different data collection modes and information sources are combined. The handbook takes a global approach, with a team of international experts looking at local and national specificities, as well as problems of cross-national, comparative survey research. The chapters are organized into seven major sections, each of which represents a stage in the survey life-cycle: Surveys and Societies Planning a Survey Measurement Sampling Data Collection Preparing Data for Use Assessing and Improving Data Quality The SAGE Handbook of Survey Methodology is a landmark and essential tool for any scholar within the social sciences.

This latest volume in the series *Psychological Assessment – Science and Practice* describes the current state-of-the-art in test development and construction. The past 10-20 years have seen substantial advances in the methods used to develop and administer tests. In this volume many of the world's leading authorities collate these advances and provide information about current practices, thus equipping researchers and students to successfully construct new tests using the best modern standards and techniques. The first section explains the benefits of considering the underlying theory when designing tests, such as factor analysis and item response theory. The second section looks at item format and test presentation. The third discusses model testing and selection, while the fourth goes into statistical methods that can find group-specific bias. The final section discusses topics of special relevance such as multi-trait multi-state analyses and development of screening instruments.

Whether you are a practicing radiation oncologist or a student of medicine, nursing, physics, dosimetry, or therapy, this handbook is a valuable resource covering the issues most pertinent to patients undergoing radiation therapy. *Handbook of Radiation Oncology* covers general oncologic principles, workup, staging, and multidisciplinary aspects of treatment, basic principles of physics and radiobiology, and specific technologies including brachytherapy, radiosurgery, and unsealed sources.
