The growth of SiGe on Si(00 1) substrates is introduced by focusing on the morphological evolution of SiGe nanostructures and the ways of precisely controlling lateral and vertical ordering. Afterwards, the chapter discusses a revolutionary process technology leading to strain-driven architectures.

Silicon and germanium are both diamond lattices. If a SiGe layer is grown on a Si(100) substrate (the standard material in Si technology) there is a lattice mismatch $f = (a_L - a_S)/a_S$ between the natural lattice constants a_L and a_S of the layer and the

2.1. Band structures. In this chapter, electronic band structures of SiGe systems are described mainly from a theoretical point of view. The electronic band structures of bulk Si, bulk Ge, and SiGe alloys are first reviewed (Yu and Cardona, 1999, Hamaguchi, 2010). Then, strain effects on the electronic band structures of pseudomorphic strained SiGe heterostructures are discussed.

similar to those of silicon CMOS manufacturing and are lower than those of other heterojunction technologies such as gallium arsenide.

Silicon-germanium - Wikipedia

SiGe nanostructures such as quantum dots and islands are appealing for applications in photonics , microelectronics , thermoelectrics , and possibly quantum computation . The fabrication of these nanostructures is often accompanied by composition inhomogeneities, as in the case of Stranski-Krastanov grown self-assembled
