Michelson-Morley experiment, an attempt to detect the velocity of Earth with respect to the hypothetical luminiferous ether, a medium in space proposed to carry light waves. First performed in Germany in 1880-81 by the physicist A.A. Michelson, the test was later refined in 1887 by Michelson and Edward W. Morley in the United States.

During this time interval, the distance travelled by the light = D . so, The velocity of light $c = [\text{Distance travelled} / \text{Time taken}] = [D / (1/8n)] = 8nD$. In general, if the number of faces in the rotating mirror is N , the velocity of light = NnD . The velocity of light determined by him is $2.99797 \times 10^8 \text{ m s}^{-1}$.

Its exact value is defined as 299 792 458 metres per second (approximately 300 000 km/s, or 186 000 mi/s). It is exact because, by international agreement, a metre is defined as the length of the path travelled by light in vacuum during a time interval of $1/299\,792\,458$ second.

Download Ebook Velocity Of Light Michelson Method Selfstudy

of Light Michelson is an American scientists, physicist, and he spent many of the years of his life in measuring the velocity of light. The method devised by him in the year 1926 at the Mount Wilson Observatory is considered accurate. Light is the wave phenomena. It is an electromagnetic wave.

Michelson's Method for Determining Velocity of Light

The correction for the velocity of light in vacuo is found by multiplying the speed in air by the index of refraction of air, at the temperature of the experiments. The error due

Experimental Determination of the Velocity of Light, by ...

In 1931, Albert Michelson devised a method of measuring the speed of light, directly, by finding how long it took to move a measured distance. The diagram below, showing the approximate arrangement of the apparatus, is not to scale (but I assume you guessed that!) Light from the source passes through a narrow slit.
